

Partner Design Studio

*From a half formed idea to a thing that runs.
In your own time, on your own laptop, with nobody to ask.*

WHAT THIS IS

A design studio that lives on your laptop

You bring an idea. It takes you from the vague version, through widening it, through finding out honestly whether it can exist and what it would cost, to building a rough version that actually runs.

It is not a chatbot and it is not a document generator. It is nine stages of design thinking with the technical judgment built into the files, so you never have to wait for a builder to tell you whether something is real.

You do not need to be technical. You need an idea and an evening.

AI made the demo roughly ten times cheaper, and the product maybe one and a half times cheaper. So the gap between them got wider, not narrower.

THE THING MOST PEOPLE GET WRONG

It removes the wait

Most ideas do not die because they were bad. They die in a queue, waiting for someone with the technical knowledge to say whether they are possible. By the time the answer comes back, the enthusiasm has gone.

This gives you that answer immediately, at any hour, as many times as you like. Whether the thing can exist. What it would genuinely cost to build. What it would have to answer to legally. And then it helps you build it.

Nobody is a bottleneck, including Shane. There is no approval step anywhere in this. The only thing that goes to a person is the final commercial call, once, at the very end.

THE METHOD

Nine stages

0	Frame the problem	CURIOUS
1	Diverge. Widen it right out	GENEROUS
2	Converge on one wedge	DECISIVE
3	Reality gate. Can it exist?	UNCOMPROMISING
4	Effort gate. What would it cost?	NUMERATE
5	Shape it. Data, loop, failure	CONCRETE
6	Build a demo. This week	HANDS ON
7	Stress test the economics	ADVERSARIAL
8	Readiness. Write the brief	STRAIGHT

The two gates sit at 3 and 4, deliberately after the widening and never during it. Nobody self censors while they are still imagining. You do not have to run all nine, and most people will not.

Three questions it will not let you dodge

Can it exist?

Every capability your idea depends on gets tiered against what actually works in production today, not what demos well on stage.

FOUR TIERS · TIER 4 IS NOT REAL

What would it cost?

Sketch, demo, MVP, product. Estimated in senior people months, with the correction applied that nearly everybody forgets.

20 TO 50× END TO END

What does it answer to?

Where you have wandered into regulated territory, why it matters, and who would actually answer it. Issue spotting, never legal advice.

SCORED 1 TO 10 · NEVER BLOCKS

HOW YOU USE IT

Three commands

/studio

The full session. All nine stages, ending in a working demo and a one page brief. An evening or two for the thinking, a weekend for the building. Stop anywhere, pick it up whenever.

/reality-check

Ten minutes. Is this possible, and what would it take? For an idea you already have, or a claim somebody made in a deck.

/build-review

Free and unlimited. Tears apart your architecture, your estimates, your assumptions. Twenty times on one idea is fine. No bar, nobody counting.

Four things worth knowing before you start

Nothing blocks you. Ever.

Not a capability that does not exist, not a governance score of ten. It flags it, scores it, explains it, and lets you keep building if the learning is worth it. Everyone becomes a builder as these tools improve. Starting early is the advantage.

There are no lanes.

No categories, no menu, nobody telling you your area is X. Bring property, bring finance, bring something for your own house. Most good ideas trip three territories at once and none of them because of who brought it.

The output is a thing that exists.

Not a deck. Stage 6 is building, because a rough thing that runs teaches you more in a weekend than a month of thinking ever will.

It stays on your machine.

Your ideas, your sessions, your half formed nonsense. Nothing is shared, and nobody sees any of it unless you decide to send it.

Start with something half formed

That is genuinely the best input. A finished idea has already had the interesting parts sanded off it.
